

# Development of Detailed AM50%ile Hybrid III Dummy FE Model

Presented at  
LS-DYNA Forum, 13 October 2011,  
Filderstadt (Stuttgart), Germany

TOYOTA MOTOR CORPORATION  
Tatsuya KOMAMURA

# CONTENTS

1. Background and Objectives
2. Development of Frontal Impact Dummy FE Model
3. Model Validation
4. Discussion
5. Conclusions

# 1-1. Background

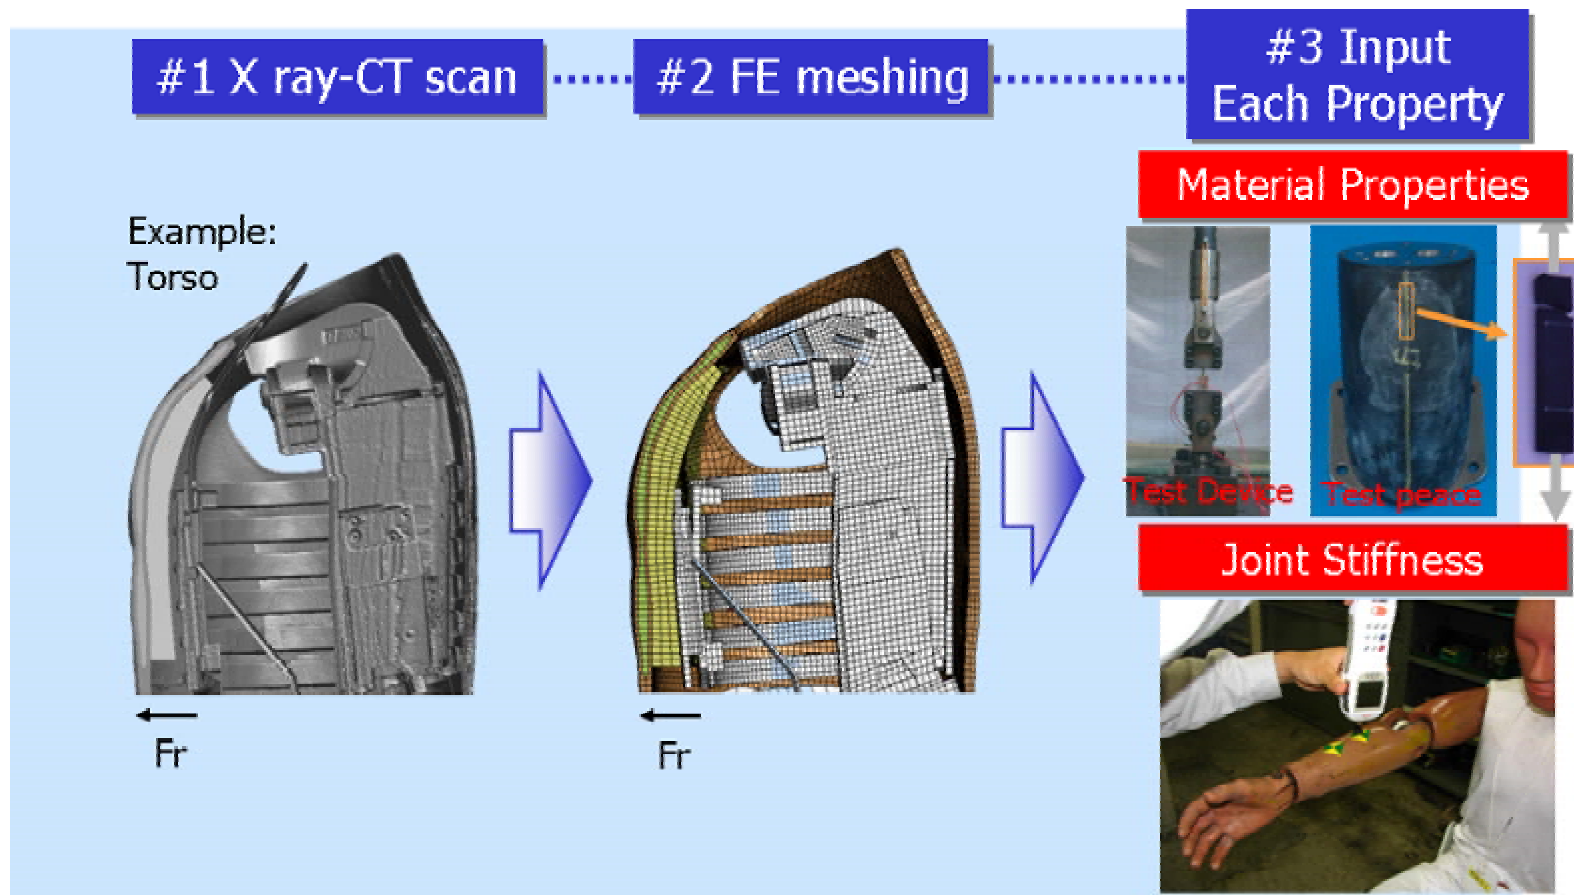

- The dummy's injury measurements are evaluated in FMVSS 208, such as head G, chest deflection and so on.
- FE analysis recently is utilized to predict the dummy responses.
- Miyazaki et al. developed a FE flex impactor model using reverse engineering technique with CT scan measurement.
- Developing a fine dummy FE model with the technique is also expected.

## 1-2. Objectives

- To develop a Hybrid III AM50<sup>th</sup> dummy model using the reverse engineering technique.
- To examine the kinematics and injury responses by comparing to those from the tests.

# 2-1. Reverse Engineering

- Fine mesh from the geometry data scanned by X ray CT.
- Input the experimentally measured material properties and joint stiffness.

## 2-2. X-ray CT scan

- Geometry data is obtained with a physical dummy at 1mm scan pitch by TMC-owned X-ray CT scanner.
- Metal and non-metal 2D images are obtained by setting X-ray threshold levels.
- 3D geometry is obtained by image reconstruction.

[Example: Torso]

X-ray CT scanner

Sectional points groups

3D geometry (STL)

# 2-3. Mesh Generation

FE mesh is made in detail to represent 3D data w/o omission

- Element size: 3-5mm for deformable parts
- Skin parts: Meshed with Solid Element

The number of elements

Part	320
Node	450,000
ELEMENT	390,000

[Overview]

[Section View]

Skin  
(Solid)

Rib  
(Shell  
And Solid)

Spine  
Box  
(Solid)

# 2-4. Material Properties

Test specimens are taken out of a new physical dummy

- Static tension tests for 49 parts
- Dynamic tension tests for 7 parts such as "Lumber spine"

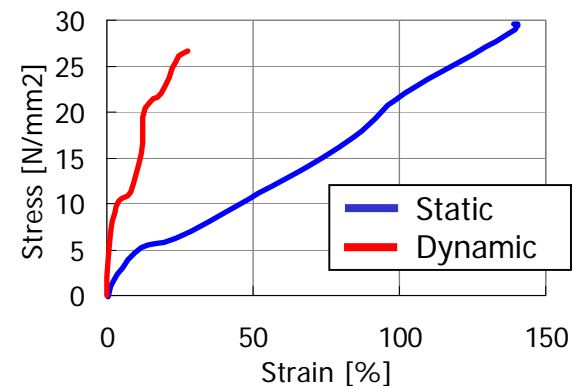

The Number of Test Specimens

Material	The No. of Specimens
Steel	26
Aluminum	5
Dumping Material	2
Rubber	8
Vinyl	5
Ensolite	1
Etc.	2

Total 49

[例: Lumber Spine]

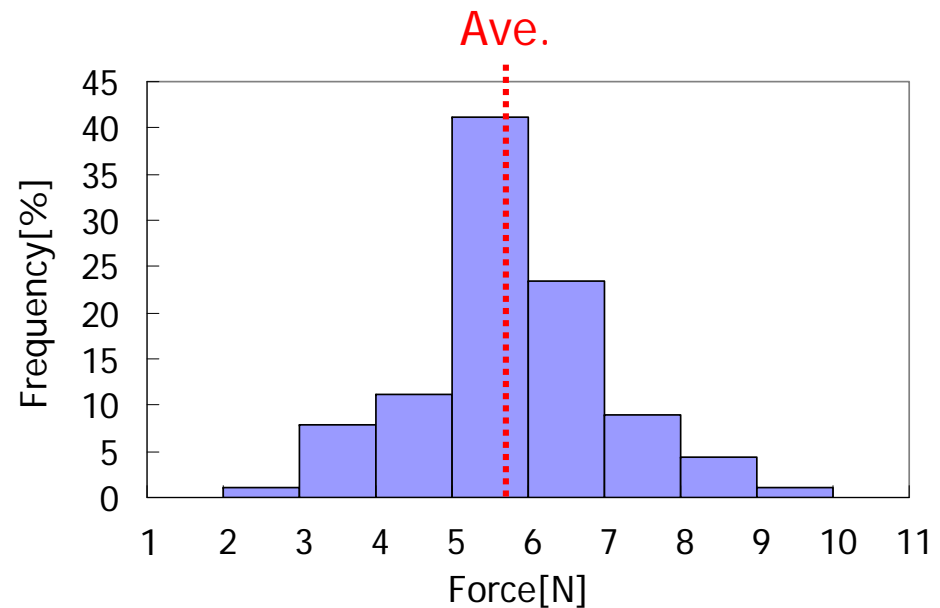

## 2-5. Mechanical Properties

- Joint stiffness is measured at 27 joints
- Ave. value from 90 data obtained at each joint is applied

[Example]

Measurement of Shoulder Joint

Measurement Result

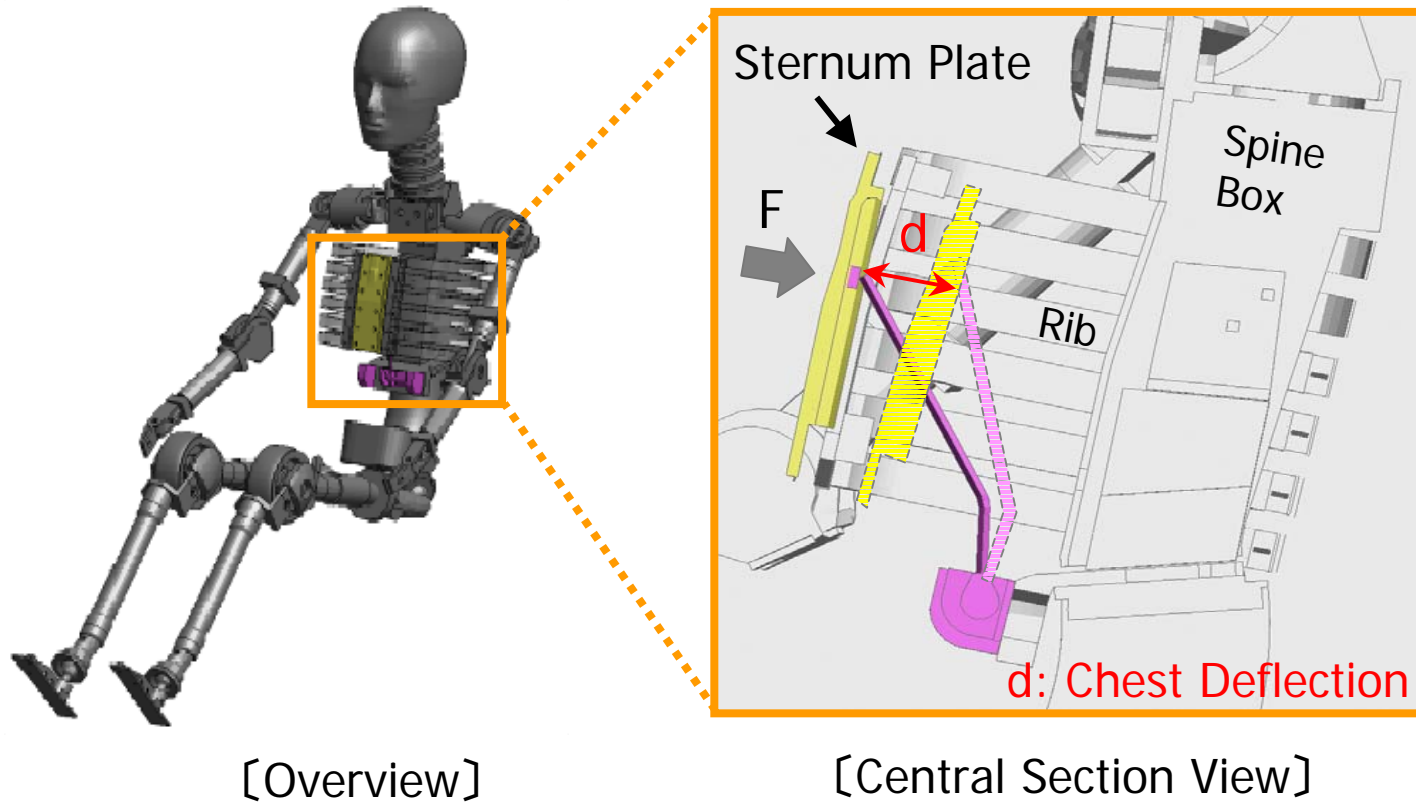

# 3-1. Model Validation

- 10 certification tests based on FMVSS208 are conducted
- Tests for chest characteristics and sled test are added

	Assembly	Standard Certification Test		Additional Test		
			Result		Result	
Component	<b>Head</b>	Head Drop Test	○			
	<b>Neck</b>	Neck Pendulum Test (+)	○			
		Neck Pendulum Test (-)	○			
	<b>Thorax</b>	Thorax Impact Test		○	Thorax Impact Test (Low Speed)	○
					Rib Static compression Test	○
					<b>Thorax Dynamic Seatbelt Test</b>	<b>○</b>
	<b>Pelvis</b>	Hip Joint-Femur Flexion Test	○			
	<b>Knee</b>	Knee Impact Test	○			
		Knee Slide Impact Test	○			
	<b>Leg</b>	Upper Foot Impact Test - without Shoe	○			
Lower Foot Impact Test - without Shoe		○				
Lower Foot Impact Test - with Shoe		○				
Sled	<b>All</b>			<b>Full Lap Sled Test</b>	<b>○</b>	

## 3-2. Measurement of Chest Deflection

- Chest deflection is equal to the displacement of the sternum plate relative to the spine box.

Measurement of Chest Deflection

# 3-3. Dynamic Seatbelt Loading

- Seatbelt tension loading on the chest fixed spine rigidly
- 2 tests of different belt path on the chest are evaluated

Test Condition

Tension velocity is aimed to simulate chest deflection rate in crash tests.

[Path A]

[Path B]

Comparison of Seatbelt Path

# 3-4. Comparison of Internal Kinematics

- The sternum plate kinematics coincide with the test.

Simulation

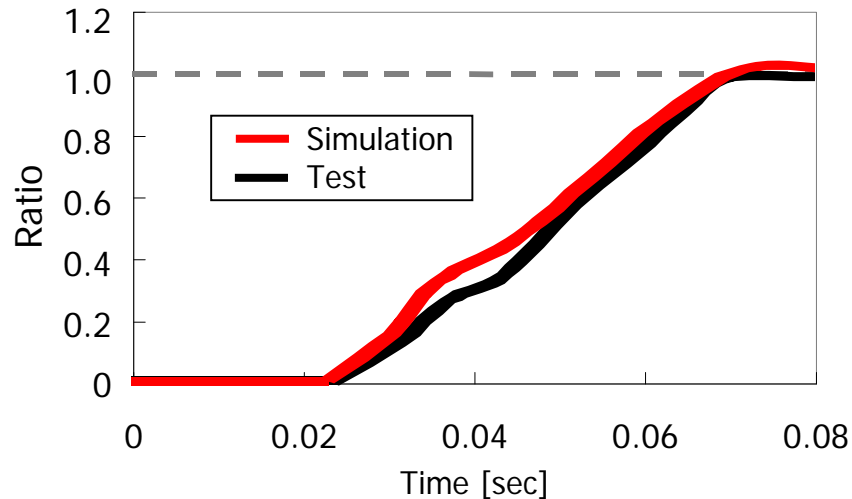

Test

# 3-5. Comparison of Chest Deflection

- Chest deflection is well coincide with the test in both 2 path conditions.

[Path A]

[Path B]

Chest Deflection (Test Max. Value Original Pass=1.0)

# 3-6. Frontal Full Lap Sled Test

- Sled condition: 48km/h Full lap frontal crash
- Restraint system: Seat, Seatbelt with force limiter

Simulation Model

Simulation Condition

Impact Velocity	48 km/h
Occupant	Passenger
Airbag	Not Available
Instrument Panel	Not Available
Seatbelt	Available
Pretensioner	Activated
Force Limiter	4 kN

# 3-7. Comparison of Kinematics

- Kinematics of FE model correlates to test.

Simulation

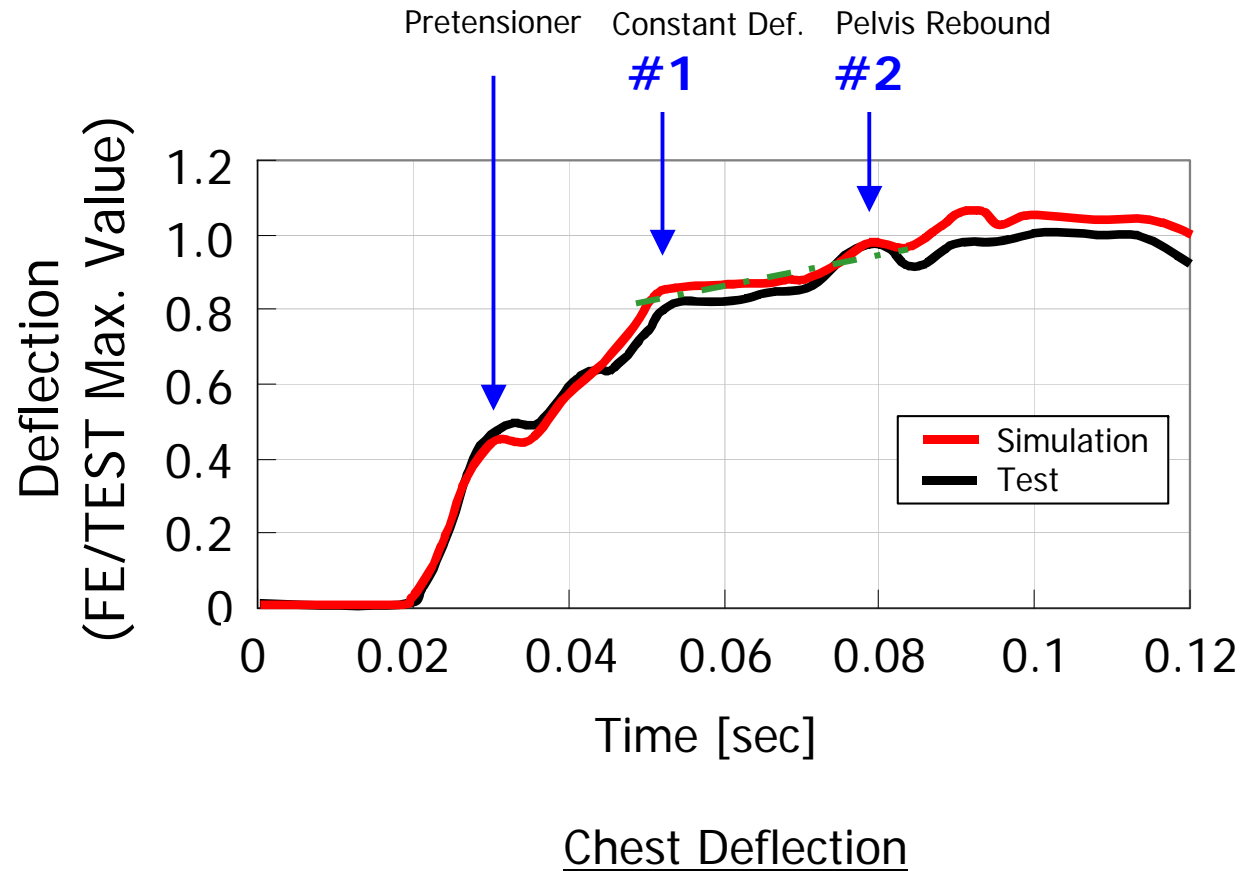

Test

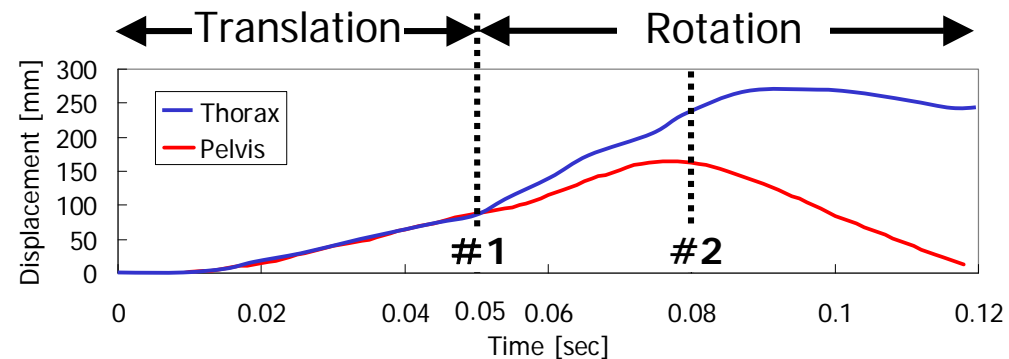

# 3-8. Comparison of Chest Def.

- Chest deflection of FE model correlate to test data.

# 4-1. Kinematics

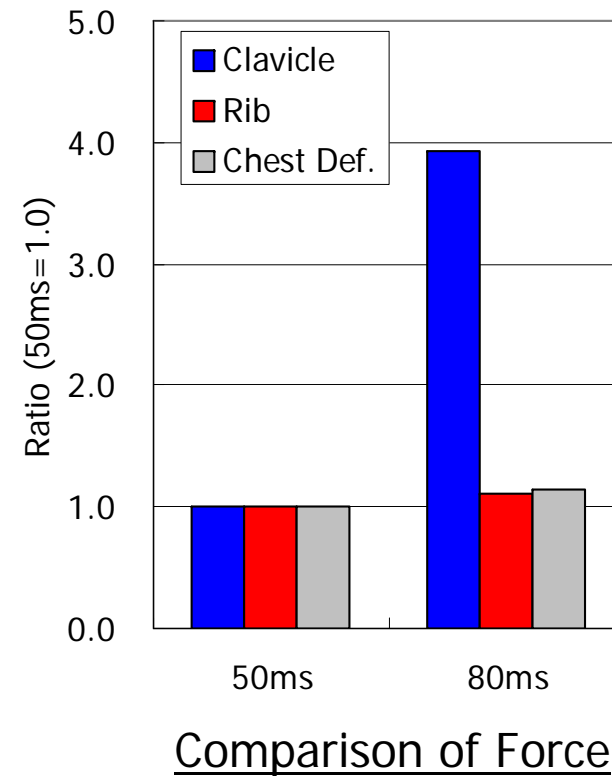

- 0~50ms: Translational movement bet. chest and pelvis
- 50ms~ : Forward movement with rotation in thorax

Displacement of Thorax and Pelvis

## 4-2. Acting Force from Belt

- 50~80ms: Acting force on clavicle increases while that Force on rib keeps constant.

Comparison of Von Mises Stress

## 5. Conclusions

- (1) Developed a detailed FE HIII Dummy model with reverse engineering using X-ray CT scans.
- (2) Material properties were studied by cutting out test specimens from dummy component parts and performed static and dynamic tests.
- (3) The force response of the developed FE model was verified in comparison tests and found to be consistent with the results obtained from a physical dummy.
- (4) It was concluded that this detailed FE model is effective for analyzing deformation and force transfer inside the dummy in crash tests.

Thank you for your attention.
